Reverse Osmosis Process

What's so great about reverse osmosis?

It's been called "the best water around," so what makes reverse osmosis water taste so superior to other types of water? Reverse osmosis or hyper filtration is actually a way of filtering water to reduce particles to a molecular level. It significantly decreases the salts and other potential impurities in the water, resulting in a high quality and great-tasting product. Even more impressive is that the reverse osmosis process produces water that is better for you.

How Reverse Osmosis (RO) Works

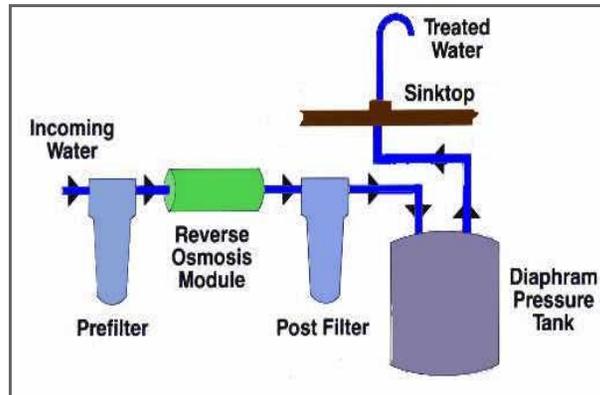

Step 1- **ION Exchange Water Softener**—removes minerals like calcium and magnesium, which can cause hard water, and also conditions the water for the RO process.

Step 2- **Activated Charcoal Filter**—removes bad tastes and odors, some micro bacteria, chlorine and some organic and inorganic contaminants.

Step 3- **Five Micron Fibre Filter**—removes all suspended particles larger than five microns from the water.

Step 4- **RO System**—removes 98.7% of the remaining impurities belonging to the six contaminant categories.

Step 5- **Ozonation**—keeps the purified water at a "zero" bacteria level while in storage waiting to be bottled. Hours after processing, the ozone simply breaks down into oxygen.

Comparison of Water:

Learn more about the water that you drink daily and the ppm (parts per million) of the Total Dissolved Solids content: (TDS).

- Tap Water (City of Houston): 250 ppm
- Bottled Water (From Well Known Brands): 0.13-0.30 ppm
- **Our Water 7SEAS: 0.02-0.04 ppm**

It would be a pleasure to serve you and be part of your ever changing life!!!
